NOISE POLLUTION MONITORING
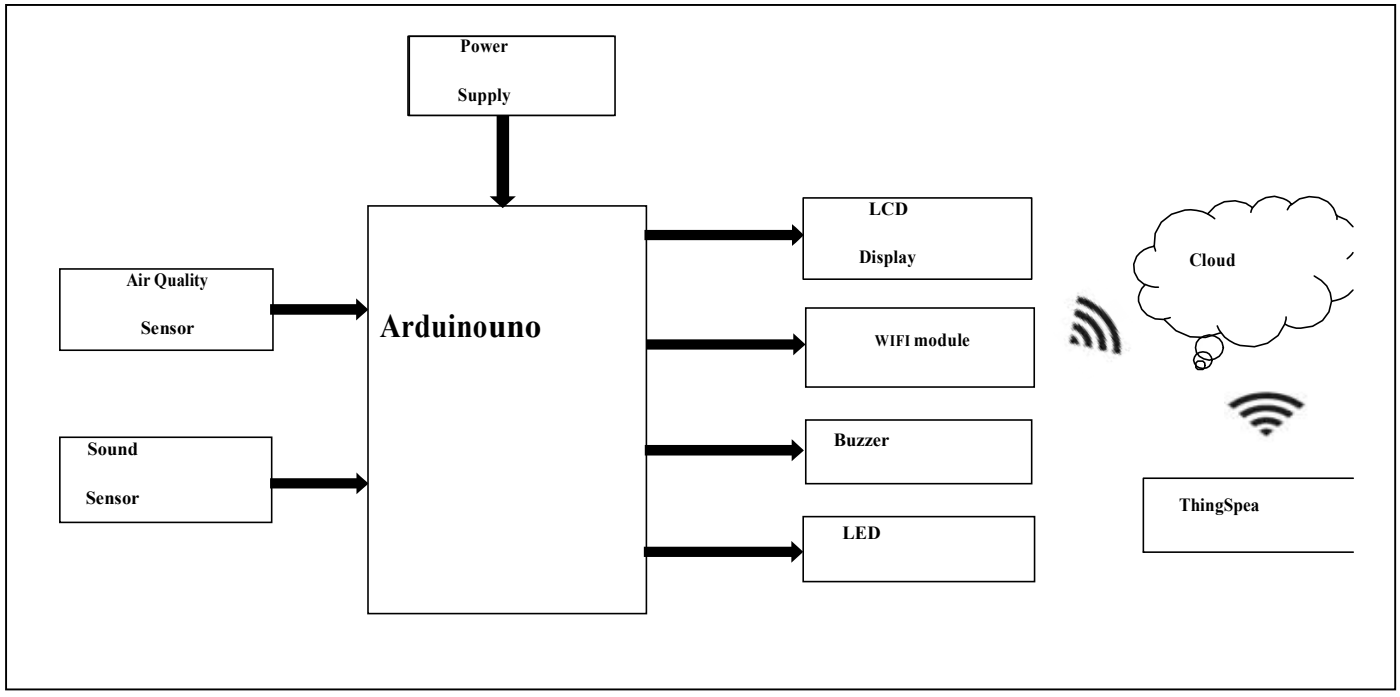
DEVELOPMENT PART 2:

Introduction:

This project presents an innovative approach to address noise pollution through an IoT-based monitoring system. By leveraging cutting-edge sensors and communication technologies, the system aims to provide real-time data on noise levels in urban environments. This data, processed through cloud-based analytics, will offer valuable insights for policymakers and urban planners to implement targeted interventions. The project's goal is to enhance public health and well-being by fostering a quieter and more sustainable living environment. Through the integration of IoT, this initiative underscores the potential of technology to mitigate environmental challenges and improve the quality of life in densely populated areas.

Block diagram:

COMPONENTS

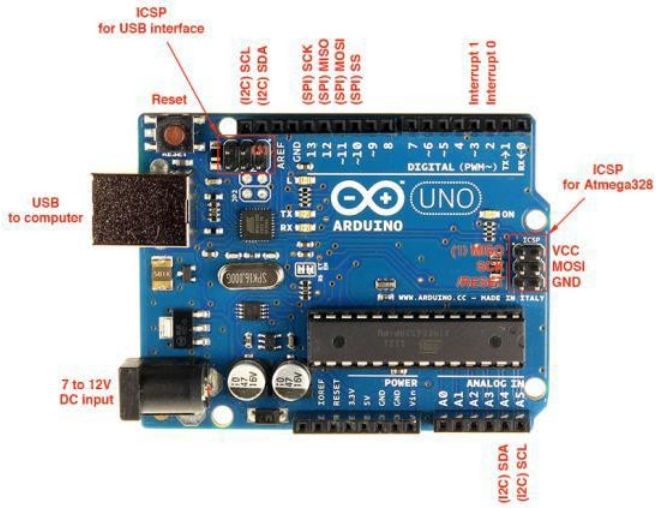


Components:

1. ArduinoUNO
2. MQ135 (Gassensor)
3. LM393 (Noisesensor)
4. ESP8266 WIFIModule
5. 16*2 LCDDisplay
6. LED
7. Buzzer

- ## Arduino UNO:

  Arduino is 8 bit microcontroller board based on the ATmega328P. The operating voltage is 5V. It has 14 pins digital input output pins (Of which can be used 6 as PWM output

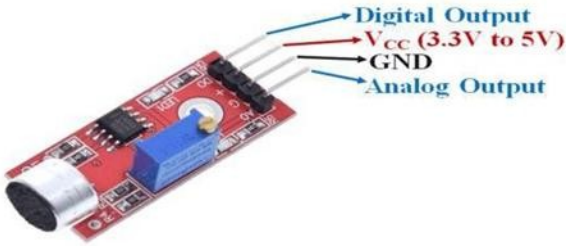


- ## MQ135 Gas Sensor:

  The MQ135 is a gas sensor it used for detecting or sensing harmful gases in the atmosphere. It has wide detecting scope. It gives fast response and also it it high sensitivity sensor. It is simple and long life device. They are used in air quality control equipment for building offices are suitable for detecting of NH3, alcohol, benzene, smoke CO2 etc.

- **LM393 Sound Sensor:**

  The sound sensor module provide an easy way to detect sound and it generally used for detecting sound intensity. Module detect the sound has exceeded a threshold value. Sound is detected via microphone and fed into an LM393 opamp.

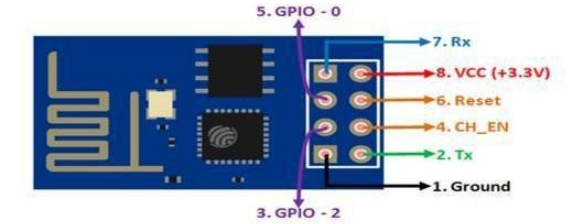


- **ESP8266 WIFI Module:**

  The esp8266 WIFI module is a self containedsoc with integrated TCP/IP protocol stack that can give any microcontroller access to your WIFI network. The esp8266 is capable of either hosting an application or offloading all WIFI networking functions from another application processor

- **16*2 LCD Display:**

  LCD is used for to display the condition there are three conditions in air pollution and three conditions in noise pollution means air and sound is clear, moderately polluted or highly polluted that is displayed on LED.



Program:

Coding:

To make and send alerting message facility via Telegram, we need to understand the skeleton of the coding. The whole program has two parts namely:

1. **Configuration code:** It consist all the backend details of Bolt IoT Wi-Fi Module and the Telegram.
2. **Main code:** It consists of the core coding of the facility.
